TECH TIP

GEARBOX ISSUES

1. LEAKS

Transmission leaks often stem from a faulty gasket or seal. Unchecked, they can lead to severe damage due to low fluid levels. Regular inspections can prevent issues. Leaking fluid may cause a noticeable smell if it contacts hot surfaces.

2. HEAT

Transmission temperature is crucial for its performance and longevity. During heavy towing or long climbs, inadequate cooling can cause overheating, affecting fluid viscosity and causing issues. Pulling over to let it cool can prevent damage and save costs.

3. MAINTENANCE

Follow the manufacturer's service interval for transmission maintenance. Despite long advertised intervals, early issues might go unnoticed. Regular checks on fluid levels, pan wear, filter replacement, and using the correct fluid can prevent long-term damage.
